

PULAK JAIN

Backend-focused Software Developer

Ahmedabad, Gujarat | +91 9998352055 | pulakpj9@gmail.com | LinkedIn | Github | Portfolio

Summary

Backend-focused full-stack developer with hands-on experience building scalable, resilient services for SaaS and enterprise workflows. Demonstrated impact: architected systems processing high-frequency telemetry (up to ~1M records/week), introduced automation that reduced manual setup time by 4x, and integrated multiple third-party services to enable payments and AI-driven features. Strong with Node.js, TypeScript, MySQL, MongoDB, message queues, and API design. Comfortable owning feature design from spec through production rollout and monitoring.

Experience

Node.js Developer, InfowareIndia

July 2024 – Present

InfowareIndia | Node.js, TypeScript, MySQL, MongoDB, Docker

Ahmedabad, Gujarat

- Led backend engineering for 7+ cross-domain products (CRM, activity tracking, field-sales automation). Owned API design, data models, and system reliability practices.
- Architected and implemented a reusable Flow Builder enabling no-code automation – 12+ components (triggers, actions, conditions).
- Integrated 5+ external services (Stripe, Razorpay, OpenAI, RAG services, LMS) with a pluggable connector design to minimize coupling and speed future integrations by 25%.
- Built high-throughput ingestion paths and batching strategies to handle telemetry spikes (design validated at ~1M records/week), using controlled concurrency, bulk writes, and backpressure handling to stabilize production.
- Improved API and DB performance using profiling, optimized SQL queries, indexing, and Sequelize refactors — realized 20–30% faster data retrieval on key endpoints and significantly reduced tail-latency.

Node.js Intern, InfowareIndia

January 2024 – June 2024

InfowareIndia | Node.js, MySQL, Sequelize, Git

Ahmedabad, Gujarat

- Designed and delivered RESTful APIs for Hospital Management System (HMS) and Alumni Portal, including ABDM-compatible flows to process patient/record interactions at scale (1,000+ exchanges tracked).
- Refactored Sequelize models and database queries, introduced pagination and optimized joins; improved typical query times by 20–30% and reduced unnecessary DB load.
- Collaborated with frontend and QA teams on contract-first API designs (OpenAPI/Swagger) and authored integration test harnesses to increase confidence during deployments.

Analyst-I Software Engineer Intern, Capgemini

June 2023 – July 2023

Capgemini | API Design, Agile

(Onsite / Remote)

- Contributed to a modular ABDM API library with focus on secure integrations and reusable functions; worked in Agile sprints and improved component reusability across features.
- Supported end-to-end integration tests, performed performance sanity checks, and documented API contracts for downstream teams.

Selected Projects & Case Studies

Activity Tracker | Node.js, TypeScript, MySQL, Sequelize, AWS

- Project goal: build a reliable real-time activity monitoring platform (application usage, attendance, keystrokes, work-hours) that scales to high-volume ingestion.
- **Challenge:** High-frequency real-time writes caused DB spikes and inconsistent server stability during peak reporting windows.
- **Approach:** Refactored ingestion pipeline with batching, p-limit concurrency control, idempotent write patterns, optimized SQL indexes, and added queueing (where needed) to smooth bursts. Added health checks and incremental rollout for DB index changes.
- **Results:** Stabilized production uptime to 99.9%, reduced DB operational load by 50%, and demonstrated handling near ~1M records/week in a staged environment.

WhatsApp CRM | Node.js, MongoDB, WhatsApp Cloud API, OpenAI

- Project goal: create a scalable WhatsApp automation platform with a no-code flow-builder for conversational workflows and integrated payments/AI.
- **Challenge:** Diverse client needs (payments, AI responses, scheduled triggers) required a modular, extensible backend able to handle scheduled tasks and maintain message-order guarantees.
- **Approach:** Built a modular Flow Builder (12+ elements), pluggable connectors for third-party services (payments, OpenAI, RAG), and a scheduler for time-driven triggers. Implemented transactional patterns for critical operations (payments + messaging).

- **Results:** Reduced automation setup time by **4x**, connected **5+** paid/AI services, and delivered reusable modules that sped up new-client onboarding.

SalesApp | Node.js, MySQL, TypeScript

- Project goal: provide field-sales automation for route planning, visit logging, inventory and order management for on-ground teams.
- **Approach:** Designed route sequencing and assignment algorithms, delivered RESTful microservices for order/inventory/visit workflows, and implemented offline-capable job queues for mobile clients.
- **Results:** Improved planning efficiency by **30–40%** for **30+** field staff, digitized core order/inventory workflows, and reduced manual route planning overhead.

Education

Pandit Deendayal Energy University

November 2020 – May 2024

B.Tech in Computer Engineering

Gandhinagar, Gujarat

Relevant coursework: Data Structures, Algorithms, DBMS, Web Technologies, Machine Learning, Operating Systems, Software Engineering

Technical Skills

Languages: JavaScript / TypeScript, C, C++, Python, SQL

Backend / Frameworks: Node.js, Express, REST APIs, Microservices, Websockets

Databases: MySQL, MongoDB, Redis

Architecture / Infra: Docker, Queueing (RabbitMQ), Cron Jobs, AWS (S3), Monitoring

Tools: Git, VS Code, Swagger / OpenAPI, Postman

Achievements & Certifications

- Published **2** peer-reviewed review papers (3+ citations). [Publications Link](#)
- HackerRank Problem Solving (Intermediate) certification.
